Security Cabinet Installation & Handling Guidelines

1. Placement & Assembly

- Upon arrival, security cabinets must be positioned in their permanent location **before** installing shelves and extrusions.
- All provided ganging hardware must be installed **prior** to placing shelves or products inside the cabinet.

2. Shelf & Door Installation

- Shelves, extrusions, and products should be placed inside the cabinet **before** doors are installed.
- Once doors are installed, they **must not** be removed for resets or restocking.

3. Door Maintenance

- If a door becomes stuck, **do not** use silicants or aftermarket lubricants.
- Stuck doors should be realigned on the extrusion track.
- A **QR code** with a door installation video is located on the **flip-down header**. Please reference this QR code for proper installation and alignment instructions.

4. Relocation Procedures

- **Security cabinets should not be moved once installation is complete.** However, if relocation is necessary, follow these steps:
 - **Remove all products** from the cabinet before moving.
 - Use **proper moving equipment** (moving straps, dollies, or any equipment that keeps the cabinet off the floor).
 - **Do not drag** security cabinets across the floor.

Following these guidelines will ensure the integrity and functionality of security cabinets while preventing damage during installation and relocation.
